

Win this week's matchup.

Spend the 36 adds only where they change a result.

Data sites list projections; nobody turns them into a decision for *your* matchup. The bot plays out every night of your matchup and the next two, values each add/drop in win probability, and tells you one plan: which move, on which day, and why.

Every night of the week, played out with your best lineup

Projected points per game (xFP)

Three seasons of history, aged, blended 50/50 with DailyFaceoff's projection, then updated with this season's games and ice time. Peripherals count: shots, hits, blocks are about half of skater points.

Who actually plays

Injured players return along curves fit on game logs (slower the more games missed); goalie start odds from confirmations, recent share, back-to-backs and the last result.

The lineup, as Yahoo would allow it

Yahoo's position eligibility; each night the best C2 LW2 RW2 D4 G2. A game on a night your slot is full is worth **nothing**. The 3-game goalie minimum is priced in (miss it and all goalie points are zeroed).

Are the slots full? Five nights, with the plan made

All 12 starting slots each night (the dashboard's "By slot" view). Open slots are where an add plays.

Night	Fri 9	Sat 10	Sun 11	Mon 12	Tue 13
C ×2	● ○	● ●	○ ○	● ○	● ●
LW ×2	● ○	● ○	● ○	○ ○	● ●
RW ×2	○ ○	● ●	● ○	○ ○	● ●
D ×4	● ● ○ ○	● ● ● ○	● ○ ○ ○	● ○ ○ ○	● ● ● ●
G ×2	○ ○	● ●	○ ○	○ ○	● ●
Your games	4	10	3	2	12
Theirs	2	12	3	5	12

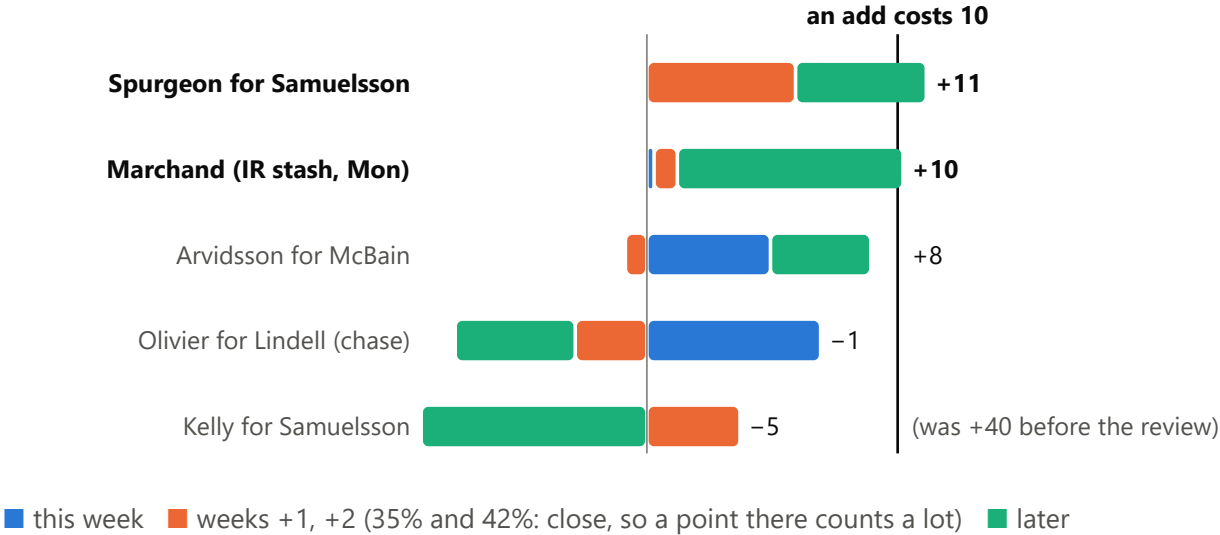

● filled ○ open: an add would play there. The plan (Spurgeon for Samuelsson, D for D) changes no slot on these nights; a move that did would show in green.

One currency: win-pts, percentage points of a weekly win

1 win-pt = 0.01 expected weekly wins, summed over every week a move touches. Today's plan, +11, is 0.11 more weekly wins expected this season; an add must buy 10 (0.1 wins) to be worth one of the 33 left.

value = $\Delta P(\text{win})$ this week + $\Delta P(\text{win})$ in weeks +1, +2 (against the real opponents) + later points × a point's worth

Today's top moves, Fri 9 Oct (win-pts)

Why not chase this week?

Olivier lifts you 16% → 22% (+7), but losing Lindell costs 3 in weeks 3–4 and 5 later: –1 in all, against the 10 an add costs. You're 26 down with most of it banked, so a point now is worth only so much.

Honest numbers, and what's untested

Team margins come true at **0.80** (0.75 / 0.70 one and two weeks ahead), per-game gaps between fringe players at **1.02** now, ~0.75 by week 20; later points get ×0.5. Missed games cost only a player's edge over a streamer (**untested**), and every top move is valued with Celebrini back and the cheapest player cut.

From a ranked table to one plan you can follow

1

Worth an add?

An add costs what it could buy later. The **add price** (10 win-pts today) is set by simulating weeks so that 2 a week at most uses the budget at its pace, 6 kept for the playoffs. Close weeks with good streamers clear it; lopsided weeks don't.

2

One coherent plan

Best move first, each next one judged with the earlier ones made: no two share a player. A keeper that does nothing this week waits for Monday **only if** another move can use this week's add, else it takes the add that would expire.

3

The exact day

The earliest day that loses no points: the dropped player's games first, the add in before his. Waiting otherwise only risks a claim. IR: an add into a spot IR opened counts only until the injured player is back.

4

Kept once seen

The plan changes only if a move can't be made (taken, skipped, injured) or a new plan is **2 win-pts** better, and says why. Week 2 had 13 cards with 4 different adds; now near-ties don't flip it.

9.7 → 10

win-pts an add must buy

A point is worth most when a matchup is close: about **0.9 win-pts** in a typical week, far less in a lopsided one. So the same +5-point stream can be a must-add in a 50% week and worthless at 90%: the rule follows from the numbers, not from a fixed "stream on Mondays".

Week 2 vs Retrot Chicken Wings

16%

to win this week

137–163 so far · expect 223–250
Lineup games left: 17 each

35% 42%

wk 3 vs Löllöt wk 4 vs Jättiläisentie

The plan

Fri 9 Oct Spurgeon for Samuelsson

Mon 12 Oct Marchand into the empty IR slot

- Spurgeon: +11 (+6 in weeks 3–4, +5 later), D for D, just above the 10 an add costs
- Marchand: +10; injured, so no drop now (check Yahoo tags him IR)
- Not Kelly: +40 before your review, **–5** now: same per game as Samuelsson, and he'd be cut when Celebrini returns

Checked against past seasons

- P(win) spread right ($\times 0.92$ – 1.03) in 2024-25 and 2025-26
- Margins shrunk to how they come true; fringe players' per-game gaps hold (1.02 now, ~ 0.75 by week 20)
- Goalie start and injury-return curves fit on one season, checked on the next

Next

A replay of 2025-26 to score every rule change on wins, playoff and title odds, and how often the plan changes.

What you get on Telegram (the plan message, then one card per move with Done / Taken / Skip)

Week 2 vs Retrot Chicken Wings: 137-163 so far, expect 223-250 (Yahoo 230-257). Win 16%.

Fri 9 Oct (today): Jared Spurgeon for Mattias Samuelsson (+11 win-pts, a keeper; uses this week's slot, so next week's two adds stay free).

Mon 12 Oct: Brad Marchand into your empty IR slot (+10 win-pts, a keeper; it does nothing this week, so it takes next week's add).

For this week alone, the best is Mathieu Olivier for Esa Lindell: win 16% -> 22%. Not worth an add: -1 win-pts in all, as dropping Esa Lindell costs 8 later, against the 10 an add costs.

Ahead: wk 3 vs Löllöt Höntsääjät 35%, wk 4 vs Jättiläisentie Giants 42%.

Adds: 1 this week, 33 this season. Playoffs 20%, title 1%.
